

Block 22.

Figure 4. Site Concept and delineated wetlands: A total of 1.2 acres of existing palustrine wetlands will be permanently filled in the following manner: the organic topsoil layer will be cleared and grubbed using a combination of bulldozer, backhoe loader, and/or skid steer equipment. After the topsoil layer has been cleared and graded the existing wetland area will be filled with structural backfill or on site cut material using a combination of dump truck, backhoe loader, and skid steer. The structural backfill will then be compacted with using sheep's foot compactors, rollers and other heavy equipment. (See Block 18 attachment, Figure 2 for the wetland mitigation plan)

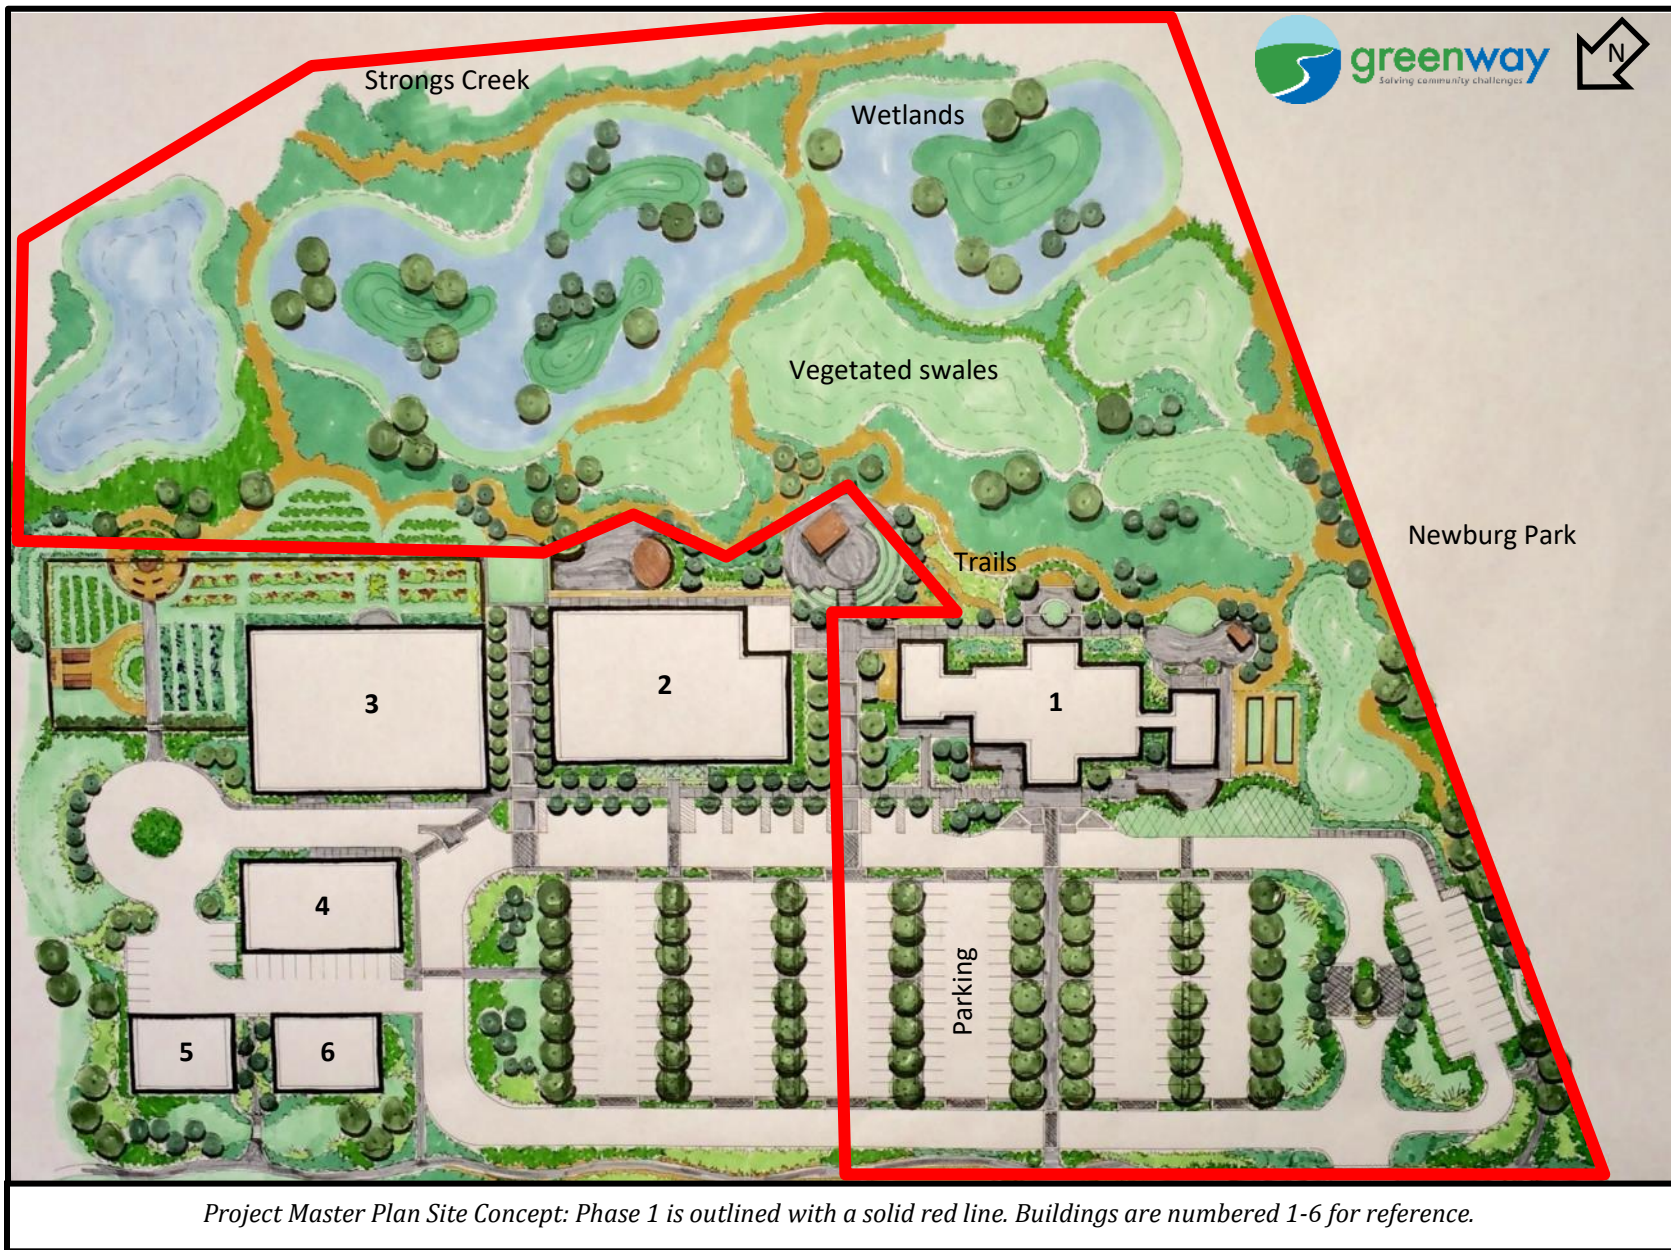

Figure 2. Site Mitigation and Planting Plan:
